Hard water can cause unseen damage to your home. Scale from hard water shortens the life of water-using appliances, increases energy usage, clogs pipes and reduces flow rate in showerheads and faucets. The EasyWater No-Salt Conditioner uses electronic scale control technology to reduce hard water build-up in your home. Your water can have a more natural feel, and water-using appliances perform as expected — without adding salt or chemicals to your water.

Protects Your Home

- Helps protect your expensive water-using appliances and fixtures
- Removes most scale from your home's plumbing, improving water flow
- Your water heater can work more efficiently and use less energy

Maintenance-Free

- Engineered to perform without any adjustments or settings

How It Works

1. Untreated Water in Your Home

Without treatment, minerals in your water can easily form scale deposits in piping, water heaters and other appliances. Scale build-up significantly decreases the efficiency and life of these appliances.

2. No-Salt Conditioner Installed

The EasyWater No-Salt Conditioner and treatment coil are configured for your application and installed on your incoming water line. Electronic scale-control frequencies pass through the wall of the pipe and condition all of the water entering your home.

3. Scale Prevented and Removed

Minerals that typically form scale are disrupted by targeted electronic frequencies, and physically changed into a state that resists adhering to surfaces and forming hard water scale. Over time, existing scale is removed from areas where the treated water flows.
